380					0.99	0.81	0.62	0.5																47kW	
440						0.94	0.72	0.57																60kW	
500						1.07	0.82	0.65																60kW	
650							1.06	0.84																77kW	
800								1.04																	

Use the buckling graph to determine a suitable **cylinder type** to lift the car/sling & load. This graph will also dictate the **loaded static pressure**.

For Example:

The buckling graphs indicate that the most suitable cylinder is a **63** and the loaded static pressure is **37 bar**.

I want the lift to move at approximately **0.2 m/s**.

(1) Locate the **cylinder type** first - **63**. **(2)** Move vertically down the column to the nearest speed shown to what is required, I want 0.2 m/s so the nearest available would be **0.19 m/s**. **(3)** The **pump** size is determined by moving horizontally left across the row to the far left column, which gives a **pump** size of **75 lpm**. **(4)** The motor size is determined by moving horizontally right across the row until you are vertically below the **loaded static pressure** of the lift - **37 bar**, which gives a **motor** size of **7.7kW**.

Use the buckling graph to determine a suitable **cylinder type** to lift the car/sling & load. This graph will also dictate the **loaded static pressure**.

For Example:

The buckling graphs indicate that the most suitable cylinder is a **125** and the loaded static pressure is **49 bar**.

I want the lift to move at approximately **0.45 m/s**.

(1) Locate the **cylinder type** first - **125**. **(2)** Move vertically down the column to the nearest speed shown to what is required, I want 0.45 m/s so the nearest available would be **0.44 m/s**. **(3)** The **pump** size is determined by moving horizontally left across the row to the far left column, which gives a **pump** size of **650 lpm**. **(4)** The motor size is determined by moving horizontally right across the row until you are vertically below the **loaded static pressure** of the lift - **49 bar**, which gives a **motor** size of **77kW**.
